#define all(x) (x).begin(), (x).end()
#define INF 1e15+9
#define DBG(x) cout<<(#x " = ") <<x<<endl;
#define pb push_back
#define fastio ios_base::sync_with_stdio(0);cin.tie(0);
using namespace std;
const int maxn = 2e5+5;
const int MOD = 1e9+7; // 998244353;
typedef pair<int,int> P;

void solve(){
    // Do Something...
}
signed main(){
    fastio
    int t=1;
    cin>>t;
    while(t--) solve();
}
```

2 DataStructure

2.1 01trie

```cpp
// for xor
const int N = 1e5+5;
int tot,trie[41*N][2],n; // need reset tot, trie
int find(int x){
    int p=0,sum=0;
    for(int i=40;i>=0;i--){
        int id=(x>>i)&1;
        if(trie[p][id^1]){ // here, choose id^1
            sum=sum*2+1;
            p=trie[p][id^1];
        }
        else{
            sum=sum*2; // here, choose id
            p=trie[p][id];
        }
    }
    return sum;
}
// fixed:
void insert(int x){
    int p=0;
    for(int i=40;i>=0;i--){
        int id=(x>>i)&1;
        if(!trie[p][id]) trie[p][id]=++tot;
        p=trie[p][id];
    }
}
```

2.2 DSU f

```cpp
struct DSU {
    vector<int> f, siz;

    DSU(){}
    DSU(int n){
        init(n);
    }

    void init(int n){
        f.resize(n);
        iota(f.begin(), f.end(), 0);
        siz.assign(n, 1);
    }

    int find(int x){
        while (x != f[x]) {
            x = f[x] = f[f[x]];
        }
        return x;
    }

    bool same(int x, int y){
        return find(x) == find(y);
    }

        }
        else cout<<query(1,l,r)<<endl;
    }
}
```

2.5 PBDS

```
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;
template<typename T> using rbt = tree<T, null_type, less<T>, rb_tree_tag
    , tree_order_statistics_node_update>;
int main(){
    rbt<int> t; //declare
}

/*
不支援重複值 (需要的話可用左推+值來處理)
```

```
支援set, map之操作
find_by_order(k) ：像陣列一樣回傳第 k 個值。(0-based, pointer)
order_of_key(k) ：回傳 k 是集合裡第幾大。(0-based)

T 資料型別
null_type //當作 map 使用的時候要對應什麼資料型態，
      //要當作 set 就用 null_type
less<T> // key value 要用什麼方式比較
*/
```

2.6 Per Seg

```
struct Per_seg{
    int l, r, m;
    int v = 0;
    Per_seg *ln = nullptr, *rn = nullptr;
    Per_seg(int _l, int _r) : l(_l), r(_r), m((_l + _r) >> 1) {}
    void build(){
        if (l != r - 1)
        {

    for(int i=0;i<n;i++){
        dfn[i]=1e9;//reset
        low[i]=1e9;
        vis[i]=0;
    }
    id=0;
    for(int i=0;i<n;i++){
        if(!vis[i]){
            tarjan(i,-1);
        }
    }
    // use
}
```

4.4 Dinic

```
(a) Bounded Maxflow Construction:
1. add two node ss, tt
2. add_edge(ss, tt, INF)
3. for each edge u -> v with capacity [l, r]:
        add_edge(u, tt, l)
        add_edge(ss, v, l)
        add_edge(u, v, r-l)
4. see (b), check if it is possible.
5. answer is maxflow(ss, tt) + maxflow(s, t)
-------------------------------------------------------
(b) Bounded Possible Flow:
1. same construction method as (a)
2. run maxflow(ss, tt)
3. for every edge connected with ss or tt:
        rule: check if their rest flow is exactly 0
4. answer is possible if every edge do satisfy the rule;
5. otherwise, it is NOT possible.
-------------------------------------------------------
(c) Bounded Minimum Flow:
1. same construction method as (a)
2. answer is maxflow(ss, tt)
-------------------------------------------------------
(d) Bounded Minimum Cost Flow:
* the concept is somewhat like bounded possible flow.
1. same construction method as (a)
```

```
2. answer is maxflow(ss, tt) + (∑ l * cost for every edge)
-------------------------------------------------------
(e) Minimum Cut:
1. run maxflow(s, t)
2. run cut(s)
3. ss[i] = 1: node i is at the same side with s.
-------------------------------------------------------
